

PHOTOCELLS

EN12978

EN13849-2

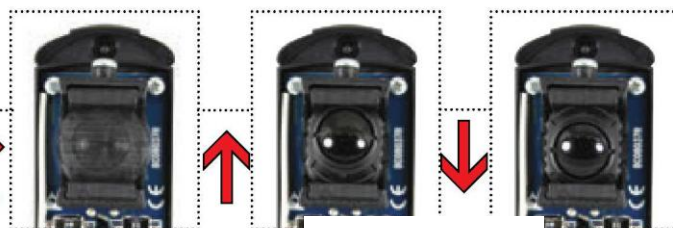

The infrared signal of the photocell can be gradually adjusted both horizontally ($-90^{\circ} \div +90^{\circ}$) than vertically ($-5^{\circ} \div +5^{\circ}$).

The transmitter and the receiver are connectable to the contacts of mechanical or resistive safety strips with NC or NO contacts.

You can install the transmitter operating with batteries on the mobile part of a sliding gate together with a safety strip to protect the gate movement in closure.

A buzzer on the receiver card signals when the batteries of the transmitter are almost discharged.

Selectable sync on 2 different frequencies.
